SENDGRID INTEGRATION WITH PYTHON

Date	19 NOV 2022
Team ID	PNT2022TMID39785
Project Name	NUTRITION ASSISTANT APPLICATION

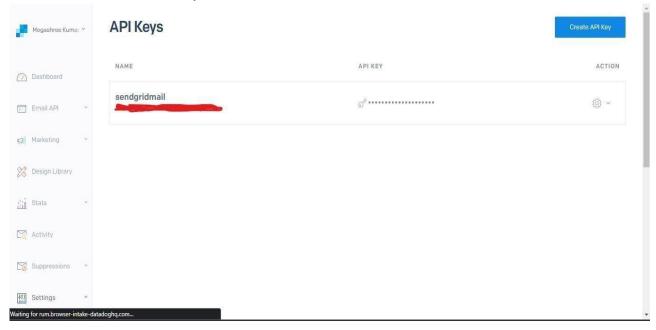

STEP 1:

REQUIREMENTS:

Python 2.6, 2.7, 3.4 or 3.5.

STEP 2:

Create an API key

STEP 3:

INSTALL

PAKAGE: > pip installsendgrid

SETP 4:

SEND EMAIL

SENDGRID PYTHON CODE:

```
1 import os
2 from sendgrid import SendGridAPIClient
3 from sendgrid.helpers.mail import Mail
5 message = Mail (
6
       from_email='from_email@example.com',
       to emails='to@example.com',
       subject='Sending with Twilio SendGrid is Fun',
8
       html_content='<strong>and easy to do anywhere, even with
9
   Python</strong>')
10 try:
11
       sg = SendGridAPIClient(os.environ.get('SENDGRID_API_KEY'))
12
       response = sg.send(message)
13
     print(response.status_code)
14
     print(response.body)
      print (response.headers)
15
16 except Exception as e:
     print (e.message)
```

HTTP CLIENT PROGRAM

```
1 """HTTP Client library"""
2 import json
3 import logging
4 from .exceptions import handle_error
5
6 try:
7  # Python 3
8  import urllib.request as urllib
9  from urllib.parse import urlencode
10  from urllib.error import HTTPError
11 except ImportError:
12  # Python 2
```

```
from urllib import urlencode

111
112
113
114
            :param query params: A dictionary of all the query
```

```
parameters
           :type query_params: dictionary
117
           ur1 = ""
119
           while count < len(self. url path):
122
123
            if self.append slash:
               url += 1/1
126
127
            query params:
                url values = urlencode(sorted(query params.items()),
130
                url = '{)?()'.format(url, url values)
131
132
133
                url = self._build_versioned_url(url)
134
135
136
137
138
        def update headers (self, request headers):
139
            :param request headers: headers to set for the API call
142
            :type request headers: dictionary
143
144
145
            self.request headers.update(request headers)
146
147
```

```
149
            :param name: Name of the url segment
            :type name: string
            url path = self. url path + [name] if name else
  self, url path
                          request_headers=self.request_headers,
                          url path=url path,
                          append slash=self.append slash,
        def make request(self, opener, request, timeout=None):

            :param request: url payload to request
            :type request: urllib.Request object
            :return: urllib response
174
176
                return opener.open(request, timeout=timeout)
179
                exc. cause = None
                 logger.debug('(method) Response: (status)
```

```
(body) . format (
                  method=request.get method(),
                    status=exc.status code,
                   body=exc.body))
                raise exc
184
186
187
               (e.g. /your/api/(variable value)/call)
              Another example: if you have a Python reserved word,
              in your url, you must use this method.
190
191
           :param name: Name of the url segment
           :type name: string
194
195
196
198
       def getattr (self, name):
               (e.g. client.name.name.method())
              You can also add a version number by using
  .version(<int>)
            :param name: Name of the url segment or method call
           :type name: string or integer if name == version
204
206
               def get version(*args, **kwargs):
                   :param args: dict of settings
                   :param kwargs: unused
```

```
212
213
                    self. version = args[0]
216
217
218
219
            if name in self.methods:
               method = name.upper()
221
                def http request (
223
                         request body=None,
224
                         query params=None,
                         request headers=None,
227
229
                    :param timeout: HTTP request timeout. Will be
 propagated to
230
                        urllib client
231
                     :type timeout: float
232
                     :param request headers: HTTP headers. Will be
  merged into
233
                         current client object state
234
                     :type request_headers: dict
235
                     :param query params: HTTP query parameters
236
                     :type query params: dict
237
                     :param request body: HTTP request body
238
                     :type request body: string or json-serializable
239
                     :param kwargs:
240
242
                    ! request headers:
```

```
243
                        self. update headers (request headers)
